

Unravel® for Spark

Unravel® for Spark

A modern generation of Application Performance Management (APM) software has emerged to support analytical, machine learning, IoT, and artificial intelligence applications running on big data platforms such as Spark, Hadoop, Kafka, and NoSQL.

Unravel for Spark provides a comprehensive full-stack, intelligent, and automated approach to application performance management (APM) across the big data architecture. The Unravel platform helps you to analyze, optimize, and troubleshoot big data apps and operations in a seamless, easy to use, and frictionless manner.

Unravel for Spark bridges the gaps that exist in current fragmented approaches for big data APM and operations management.

The Unravel for Spark provides a 360° view into the behavior of Spark applications on a single glass pane with all relevant and correlated information. Some of the unique capabilities, include:

Locate and analyze Spark app performance

- KPIs specific to an application, such as status, duration, data I/O, # of stages, tasks, etc.
- Drill down views from Spark jobs to stages to task execution; Gantt chart of stage timelines to bottlenecks, errors, task logs of drivers and executors, and configurations

AI driven Intelligence engine provides insights into

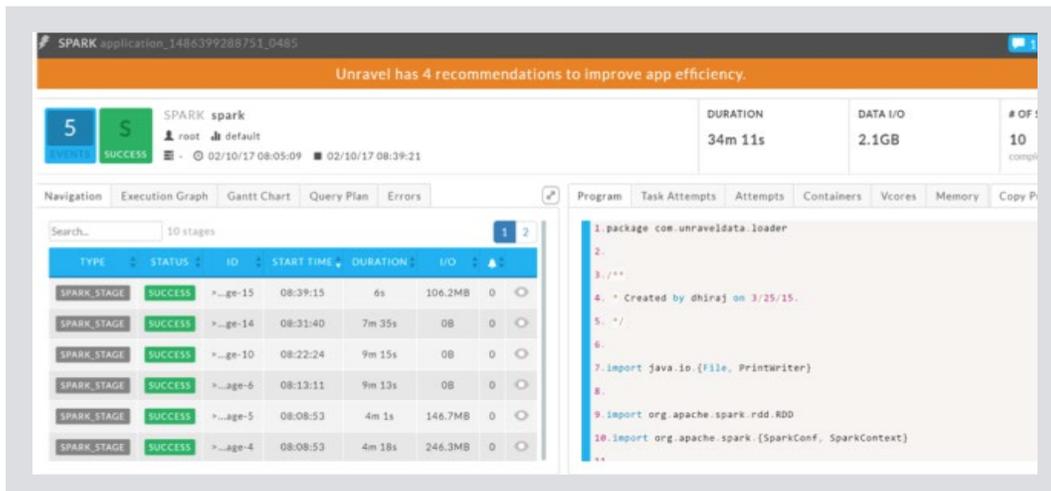

- Utilization of memory resources and Spark storage memory
- RDD Caching, CPU resource contention, and container resource utilization

AI driven recommendation engine to improve app efficiencies in simple English

- Spark executor memory/instances value
- Spark default parallelism new value

For failing and inefficient Spark Apps, Unravel provides

- Root cause analysis error view —metric and parameter tweaks to get the app back running
- Pro-active alerts to detect/eliminate rogue apps that can affect cluster performance, resource utilization and SLA requirements

The screenshot displays the Unravel Spark application interface. At the top, a banner indicates "Unravel has 4 recommendations to improve app efficiency." Below this, a summary card shows the application name "SPARK spark", user "root", and status "SUCCESS". Key metrics include a duration of "34m 11s", data I/O of "2.1GB", and 10 completed tasks. The interface includes navigation tabs for "Execution Graph", "Gantt Chart", "Query Plan", and "Errors". A table lists 10 stages, all with a "SUCCESS" status. The right-hand pane shows the source code for a Spark program, including package declarations, imports, and RDD operations.

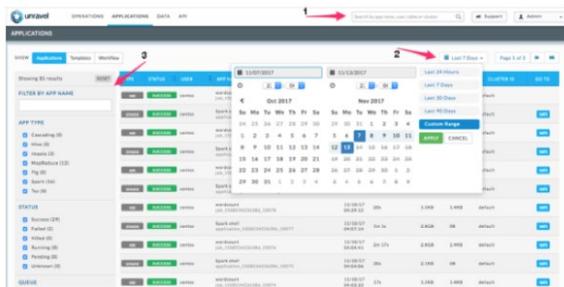

TYPE	STATUS	ID	START TIME	DURATION	I/O
SPARK_STAGE	SUCCESS	*_ge-15	08:39:15	6s	106.2MB 0
SPARK_STAGE	SUCCESS	*_ge-14	08:31:40	7m 35s	0B 0
SPARK_STAGE	SUCCESS	*_ge-10	08:22:24	9m 15s	0B 0
SPARK_STAGE	SUCCESS	*_age-6	08:13:11	9m 13s	0B 0
SPARK_STAGE	SUCCESS	*_age-5	08:08:53	4m 1s	146.7MB 0
SPARK_STAGE	SUCCESS	*_age-4	08:08:53	4m 18s	246.3MB 0

```
1 package com.unraveldata.loader
2.
3. /**

5.  */
6.
7. import java.io (File, PrintWriter)
8.
9. import org.apache.spark.rdd.RDD
10. import org.apache.spark (SparkConf, SparkContext)
11.
```

Business benefits of using Unravel

Unravel makes sure businesses can achieve their goals with big data spark applications. Some of the tangible benefits, include:

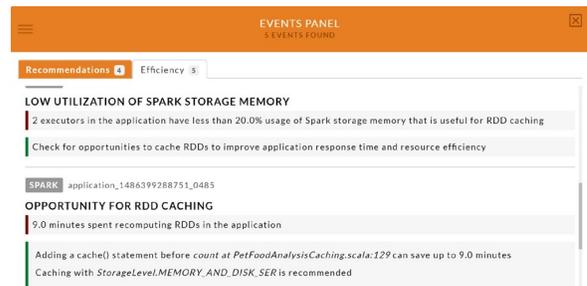

- Improved reliability to meet SLAs, ensuring no disruption in revenues
- Optimized resource utilization, resulting in lower infrastructure and project costs
- Improved productivity for all stakeholders

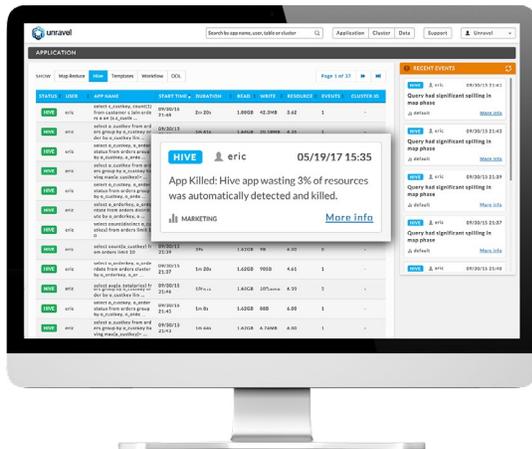

Search for your app(s) in a variety of ways

Other features include:

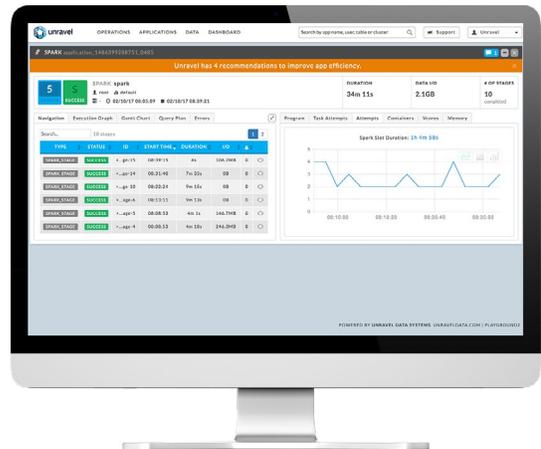

- Errors and warning messages
- Graph the resources the application/job/ stage consumed
- Histograms showing the distribution of map and reduce task duration, input and output size
- Donut graphs show the percentage of successful (green) and of failed (orange) tasks

Events/Recommendations/Efficiency: query used too many reducers. Unravel shows that this query has one job using too many reduce tasks, and provides a recommendation for the configuration

Enforcing automated policies and actions to meet SLA needs, diagnose and kill rogue apps

Built-in intelligence KPIs, tasks, jobs, stages related to an application (left) Attempts, containers, memory (right)
